xgboost

```r
library(mlr3)
library(mlr3learners)
library(mlr3filters)
library(mlr3pipelines)
library(mlr3tuning)
library(paradox)
library(tidyverse)
library(ggplot2)
library(future)
library(future.apply)
```

```r
future::plan("multiprocess")
```

```
## Warning: Strategy 'multiprocess' is deprecated in future (>= 1.20.0). Instead,
## explicitly specify either 'multisession' or 'multicore'. In the current R
## session, 'multiprocess' equals 'multisession'.
```

xgboost Upload Rate Prediction

Reading the Data

First, the data has to be read from the .csv file:

```r
data_dir = "../datasets/"

dataset_ul = read_csv(
  str_c(data_dir, "dataset_ul.csv"),
  col_types = cols(scenario=col_factor())
)

dataset_ul_prediction = dataset_ul %>% select(
  scenario,
  velocity_mps,
  acceleration_mpss,
  rsrp_dbm,
  rsrq_db,
  rssnr_db,
  cqi,
  ta,
  payload_mb,
  f_mhz,
  throughput_mbits
)

# remove missing values
dataset_ul_prediction = dataset_ul_prediction %>% drop_na()
glimpse(dataset_ul_prediction)
```

```
## Rows: 6,168
## Columns: 11
## $ scenario         <fct> campus, campus, campus, campus, campus, campus, c...
## $ velocity_mps     <dbl> 11.80, 11.83, 11.70, 11.45, 11.49, 7.93, 8.15, 8....
## $ acceleration_mpss <dbl> 0.13, 0.03, 0.06, -0.32, -0.26, 0.23, 0.24, 0.32,...
## $ rsrp_dbm         <dbl> -99, -85, -121, -84, -97, -96, -74, -108, -111, -...
## $ rsrq_db          <dbl> -9, -5, -15, -6, -12, -12, -5, -9, -13, -11, -6, ...
## $ rssnr_db         <dbl> -1, 22, -8, 11, -2, 5, 29, 2, 6, 11, 13, 16, -3, ...
## $ cqi              <dbl> 8, 10, 4, 13, 9, 5, 15, 2, 6, 15, 12, 9, 6, 11, 1...
## $ ta               <dbl> 9, 7, 63, 4, 7, 7, 4, 21, 16, 7, 4, 4, 7, 16, 4, ...
## $ payload_mb       <dbl> 1.0, 4.0, 6.0, 2.0, 6.0, 5.0, 4.0, 10.0, 0.1, 7.0...
## $ f_mhz            <dbl> 1750, 1720, 1770, 1720, 1750, 1750, 1720, 1770, 1...
## $ throughput_mbits <dbl> 4.66, 24.52, 1.29, 14.86, 3.97, 6.52, 16.27, 3.18...
```

Next, a prediction task has to be created to work with mlr3. The goal is to predict the variable throughput_mbits.

```
task = TaskRegr$new(
  id = "ul_prediction",
  backend = dataset_ul_prediction,
  target = "throughput_mbits"
)
task
```

```
## <TaskRegr:ul_prediction> (6168 x 11)
## * Target: throughput_mbits
## * Properties: -
## * Features (10):
##   - dbl (9): acceleration_mpss, cqi, f_mhz, payload_mb, rsrp_dbm,
##     rsrq_db, rssnr_db, ta, velocity_mps
##   - fct (1): scenario
```

Creating the Prediction Pipeline

The next step is to create the prediction pipeline. It will consist of a factor encoding followed by the xgboost learner. The method for factor encoding is one-hot encoding.

```
factor_encoding = po("encode", method = "one-hot", affect_columns = selector_type("factor"))
xgboost = lrn("regr.xgboost")
pipe = factor_encoding %>>% xgboost
```

Let's see what the pipeline looks like:

```
pipe$plot(html=FALSE)
```
Now the pipeline has to be converted to a learner so it can be used during training and prediction:

```
learner = GraphLearner$new(pipe)
```

Parameter Tuning

First, we have to define the set of parameters we use to tune the learner:

```
parameters = ParamSet$new(list(
  ParamInt$new("regr.xgboost.nrounds", lower=10, upper=100),
  ParamDbl$new("regr.xgboost.gamma", lower=0, upper=10),
  ParamInt$new("regr.xgboost.max_depth", lower=1, upper=10),
  ParamDbl$new("regr.xgboost.min_child_weight", lower=1, upper=100)
))
```

Next, we specify the tuning algorithm. For now, we use grid search:

```
tuner = tnr("grid_search", resolution=10)
```

Now all that is left is putting together the parts using the AutoTuner class. The resulting object is a learner that can automatically tune its parameters using the algorithm we specified.

```
tuned_learner = AutoTuner$new(
  learner = learner,
  resampling = rsmp("cv", folds = 5),
  measure = msr("regr.mae"),
  search_space = parameters,
  terminator = trm("evals", n_evals=100),
```

```
  tuner = tuner
)
```

Training the Learner

```
result = resample(
  task = task,
  learner = tuned_learner,
  resampling = rsmp("cv", folds=5)
)
```

```
